Types of Logic ICs

Transistor-Level Structure Outline

1. CMOS Logic Gate Design
2. Standard Cell Layout & Channel Routing
3. Gate Array Layout
4. Sea of Gates
5. CMOS Layout Guideline
6. Transmission Gate Layout
7. MUX Layout
8. Pass-Transistor Logic

Transistor-Level Structure Outline

1. CMOS Logic Gate Design
2. Standard Cell Layout & Channel Routing
3. Gate Array Layout
4. Sea of Gates
5. CMOS Layout Guideline
6. Transmission Gate Layout
7. MUX Layout
8. Pass-Transistor Logic

Rapid Prototyping

1. Prototyping: $Q \ll Q_{\text{product}}$ for test, debug, verification.
2. Rapid Prototyping: $t(Q) \ll t(Q_{\text{product}})$
3. Usual Rapid Prototyping wrt. Full Custom
 - Semi-Custom: saving the prior processes
 - Weinberger Array, Gate Array, SOG, e.t.c.
 - Standard-Cell: saving
 - PLD
 - 1) SPLD
 - 2) CPLD
 - 3) FPGA

Weinberger Array (NOR Logic)

$$F = (A+B+C)D \quad \text{Out} = \overline{A+B+C+D}$$

Gate Matrix

Gate Array

SOG: Sea-of-Gates

Example of SOG Design

Physical Layout Skills

1. Widening methods:

2. Crossover:

Physical Layout Skills

3. Dog-bone/Dog-Leg: No need to change layers for crossing

4. More usage of white space: Rubber forcing

Folding Lines of Diffusion

Example: Full Adder

Folding Lines of Diffusion

Example: Full Adder

Folding Lines of Diffusion

Example: Sum=A⊕B⊕C

Connections of Standard Cells

1. Butting

1. Wired

3. Feedthrough

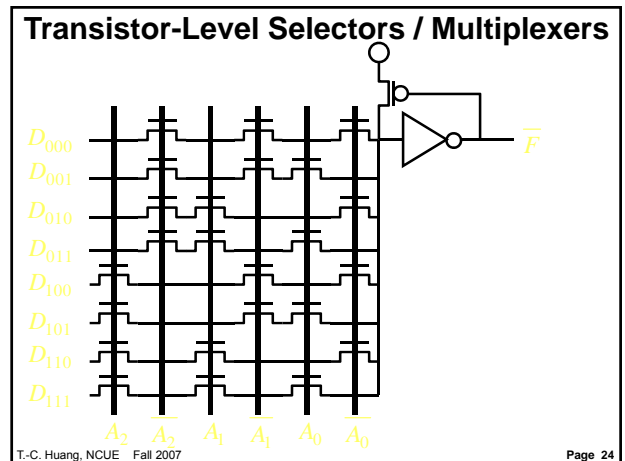

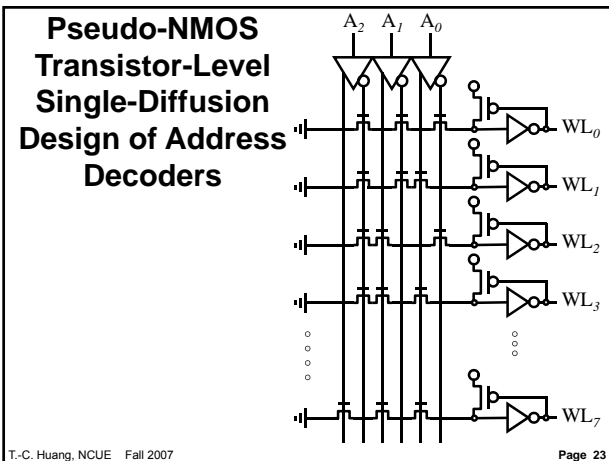

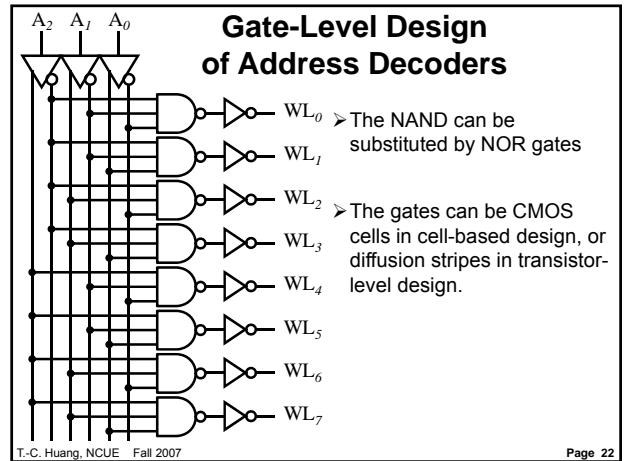

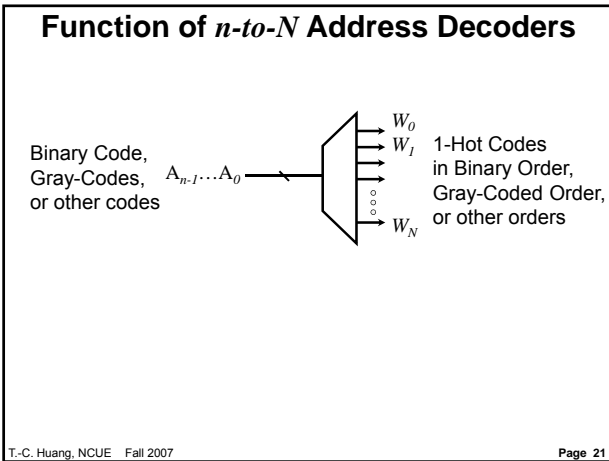

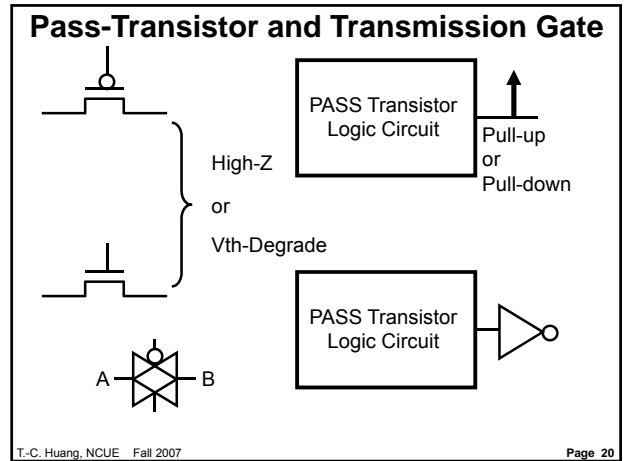

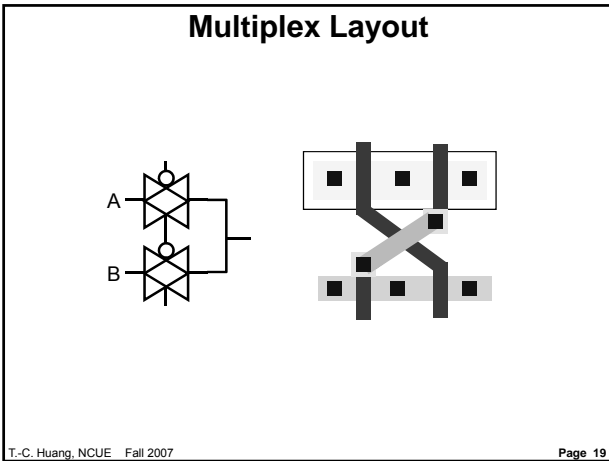

Transmission Gate Layout Consideration

Multiplex

CMOS Logic Structures

1. Conventional Logics
2. RAM/ROM-based Logic (dense, easily configurable)
3. Fully/Partially Complementary Logic (CMOS) (dense, LP)
4. BiCMOS Logic (improving drive, fanout)
5. NMOS-like Logic (high fanin, half transistor count)
6. Source Follower Pull-up Logic (SFPL, '92, improving speed)
7. Pass-Transistor Logic (PTL) ($\rightarrow 1/4$ count, V_t -drop)
8. Transmission-Gate Logic (TGL) (complementary)
9. Clocked CMOS Logic (reducing glitch, speedup)
10. Dynamic CMOS Logic (speedup)
11. Domino Logic ('82)
12. Differential Cascode Voltage Switch Logic (DCVSL, '84, IBM)
13. True Single-Phase Clocked Logic (TSPC, '89)
14. Complementary Pass-Transistor Logic (CPL, '90)
15. Differential Domino CMOS Logic
16. MOS Current-Mode Logic (MCML, '96)

T.-C. Huang, NCUE Fall 2007

Page 25

1. Conventional Logics

Bipolar Junction Transistor (BJT)

- Relay Logic
 - Ladder Diagram, incomplete logic
- Sequentially Accumulated (Computed) Logic
 - Input, calculated, and output in MCU; Very slow applications
- DRL (Diode-Resistor Logic)
 - Pulled by R, almost passive
- TDL (Transistor-Diode Logic)
- TRL (Transistor-Resistor Logic)
- TTL (Transistor-Transistor Logic)
 - Standardized, 0~0.4/2.8~5V
- ECL (Emitter-Coupled Logic)
 - Fast, high power dissipation
- Integrated Injection Logic
 - Basically, a Wired AND logic at the collector; 1972

T.-C. Huang, NCUE Fall 2007

Page 26

2. RAM/ROM-based Logic

A Logic Unit in Some CPLD

ABC	W	X	Y	Z
000	0	0	0	0
001	0	0	1	1
010	1	0	0	1
011	1	0	0	0
100	0	1	0	0
101	1	0	0	0
110	0	0	1	0
111	0	0	0	1

- Universal but exponential size wrt. input count.
- Easily synthesizable
- Flexible and reconfigurable for both RAM and logics.
- Usually utilized in most CPLD.

T.-C. Huang, NCUE Fall 2007

Page 27

3. Standard CMOS Logic Structures

Complementary MOS Logic

T.-C. Huang, NCUE Fall 2007

Page 28

4. BiCMOS Logic Structures

BiCMOS Logic

- Compared with Bipolar Logics:
 - CMOS Logics: Low power ($I_{DDQ} \rightarrow 0$)
 - Poor drive capability
- Basic idea of BiCMOS Inverter:

T.-C. Huang, NCUE Fall 2007

Page 30

5. NMOS Logic Structures

NMOS Inverter

5. Pseudo-nMOS Structures

5. NMOS-like Structures

NAND-Type (Pseudo-) NMOS Circuit

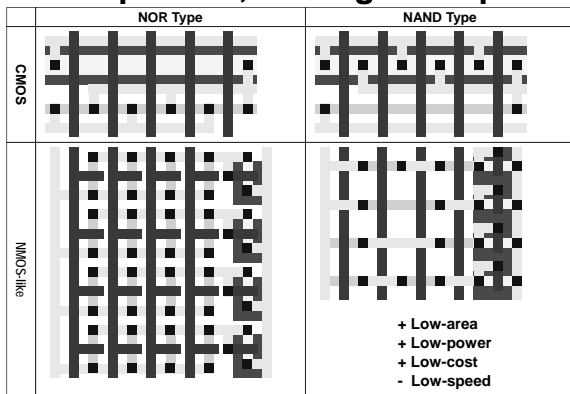

Body Effect!
Compact, low-power but slower.

5. NMOS-like Logic Structures

NOR-Type (Pseudo-) NMOS Circuit

5. Compaction, Leakages & Speed

Programmable Logic Array (PLA)

7. Pass-Transistor & Transmission Gate

High-Z
or
Vth-Degrade

PASS Transistor Logic Circuit

Pull-up or Pull-down

PASS Transistor Logic Circuit

PTL Exclusive OR Gate

Pass-Transistor Logic Synthesis

A B

A B

F

A B

1. Popularly used in modulo-2 logic, such as \oplus in LFSRs
2. Tradeoff btw speed, area and power-dissipation.

CMOS Logic Structures

TTL-Interface Inverter

T.-C. Huang, NCUE Fall 2007 Page 44

CMOS Logic Structures

General Dynamic CMOS Logic

- General Dynamic CMOS Logic:
 - IDD Path is turned off when clock-disabled and/or the output is evaluated when clock-enabled.
- In general:
 - Basic Dynamic CMOS n-Logic.
 - Basic Dynamic CMOS p-Logic.
 - Clocked CMOS Logic.
 - Domino Logic

T.-C. Huang, NCUE Fall 2007 Page 45

CMOS Logic Structures

Basic Dynamic CMOS Logic with n-Logic

T.-C. Huang, NCUE Fall 2007 Page 46

CMOS Logic Structures

Erroneous Evaluation in Cascaded Dynamic n-Logics

- They are evaluated at the same clock edges.
- Even slow evaluation may be impossible if the output has been discharged by pre-charged inputs.

Complementary Clocked, Non-inverting or Zipper

T.-C. Huang, NCUE Fall 2007 Page 47

CMOS Logic Structures

Clocked CMOS Logic (C²MOS)

T.-C. Huang, NCUE Fall 2007 Page 48

CMOS Logic Structures

Tri-State Inverter

A primitive in Verilog: `notif1`

T.-C. Huang, NCUE Fall 2007 Page 49

CMOS Logic Structures

Domino Logic

- The output won't be discharged by pre-charged inputs.
- Evaluation (clock) time should be $> t_r, X \#stages$
- Limitations:
 - Buffer, non-inverting, charge redistribution

T.-C. Huang, NCUE Fall 2007 Page 50

CMOS Logic Structures

Wave Logic

- The timing is much critical.
- Very low immunity.

T.-C. Huang, NCUE Fall 2007 Page 51

CMOS Logic Structures

Domino Logic

- A weak pull-up p-device is used to balance the threshold and to make it static.
- The weak device is fed back -- a latch-version .

T.-C. Huang, NCUE Fall 2007 Page 52

CMOS Logic Structures

NP Domino Logic (Zipper CMOS)

- Dynamic circuit, small area, small parasitic capacitance;
- Glitch-free if designed carefully.

T.-C. Huang, NCUE Fall 2007 Page 53

CMOS Logic Structures

Multi-output Domino Logic (MODL)

T.-C. Huang, NCUE Fall 2007 Page 54

CMOS Logic Structures

Charging Sharing Problem in Domino Logic

CMOS Logic Structures

Cascade Voltage Switch Logic (CVSL)

- Can be minimized;
- Can be implemented in clocked version, w/ pulled/latched devices.
- Good DC noise immunity => double railed for low voltage.

MOS Current-Mode Logic (CML)

- The highest MOS logic recently (1996)
- CVSL and CML provide complement logic outputs.
- Differential pair operates either in the saturation or cut-off regions.
- Current switch occurs at the point of maximum transconductance for both MOSFETs.
- Propagation delay is proportional to the output swing, independent from the supply voltage.
- Constant amount of current is drawn from power supply, independent from the switching activity.
- Much more efforts on dedicate design comparable to the multiple stage OPA design!

MOS Current-Mode Logic (CML)

Example

	B	0	1
A	0	F	F
	1	F	F
